## Functions:

cbg1\_enc\_default()-----4

cbg1\_enc\_advanced()-----5

cbg1\_encToFile\_default()-----7

cbg1\_encToFile\_advanced()-----8

cbg1\_get\_trans\_pixel()-----10

cbg1\_get\_huffman\_stream()-----11

## Struct:

cbg\_codec::api\*-----12

```
cbg_codec::api* cbg1_enc_default
( int height,
  int width,
  int color_depth,
  unsigned char/BYTE *raw_pixel_buffer)
```

## Explanation:

- Encode to cbg image format by pixels in raw pixel buffer and use height, width and depth you pass. Write the cbg bit stream (include “CompressedBG\_\_\_” magic bytes and all file header information.) in a bitstream buffer.
- libcbg will return a “cbg\_codec::api\*” type struct pointer. Change to P15 to read more about this struct.
- libcbg will use default key (0x31676263 or “cbg1”) and write default encoder information (“bylibcbg”).
- libcbg will use default huffman coding settings(multithreads).

## Error codes:

- 0x1: Height or width are wrong. (negative or zero).  
Tips: check height and width and pass a correct num.
- 0x2: Wrong or not support color depth.  
Tips: check color depth and pass a correct num.

```
cbg_codec::api* cbg1_enc_advanced
( int height,
  int width,
  int color_depth,
  unsigned int/DWORD key,
  char *encoder_information,
  bool huffman_coding_settings,
  unsigned char/BYTE *raw_pixel_buffer )
```

## Explanation:

- Encode to cbg image format by pixels in raw pixel buffer and use height, width, depth and key you pass. Write the cbg bit stream(include “CompressedBG\_\_\_” magic bytes and all file header information.) in a bitstream buffer.
- libcbg will return a “cbg\_codec::api\*” type struct pointer. Change to P15 to read more about this struct.
- libcbg will write encoder information you pass.
- libcbg will use singlethread if the huffman coding settings is false, and will use multithreads if it is true.

Tips: libcbg will not use less memory if you use singlethread coding.

Maybe support in next version? (maybe).

## Error codes:

- 0x1: Height or width are wrong.(negative or zero).

Tips: check height and width and pass a correct num.

- 0x1: Wrong or not support color depth.

Tips: check color depth and pass a correct num.

## Warning codes:

- 0x101: Encoder information is too long(Out of 8 bytes).

Tips: libcbg will only be use first 8 bytes character.

```
int cbg1_encToFile_default
( int height,
  int width,
  int color_depth,
  unsigned char/BYTE *raw_pixel_buffer,
  char *filename)
```

### Explanation:

- Encode to cbg image format by pixels in raw pixel buffer and use height, width and depth you pass. Write the cbg bit stream (include “CompressedBG\_\_\_” magic bytes and all file header information.) in bit stream buffer. Write the bit stream in a file you designated and only return a succeeded code(0x0).
- libcbg will use default key (0x31676263 or “cbg1”) and write default encoder information (“bylibcbg”).
- libcbg will use default huffman coding settings(multithreads).

### Error codes:

- 0x1: Height or width are wrong.(negative or zero).  
Tips: check height and width and pass a correct num.
- 0x2: Wrong or not support color depth.  
Tips: check color depth and pass a correct num.

```

int cbg1_encToFile_advanced
(
    int height,
    int width,
    int color_depth,
    unsigned int/DWORD key,
    char *encoder_information,
    bool huffman_coding_settings,
    unsigned char/BYTE *raw_pixel_buffer,
    char *filename)

```

## Explanation:

- Encode to cbg image format by pixels in raw pixel buffer and use height, width, depth and key you pass. Write the cbg bit stream(include “CompressedBG\_\_\_” magic bytes and all file header information.) in bit stream buffer. Write the bit stream in a file you designated and only return a succeeded code(0x0).
- libcbg will write encoder information you pass.
- libcbg will use singlethread if the huffman coding settings is false, and will use multithreads if it is true.

Tips: libcbg will not use less memory if you use singlethread coding.

Maybe support in next version? (maybe).

## Error codes:

- 0x1: Height or width are wrong.(negative or zero).

Tips: check height and width and pass a correct num.

- 0x2: Wrong or not support color depth.

Tips: check color depth and pass a correct num.

## Warning codes:

- 0x101: Encoder information is too long(Out of 8 bytes).

Tips: libcbg will only be use first 8 bytes character.

```
cbg_codec::api* cbg1_get_trans_pixel  
( int height,  
   int width,  
   int color_depth,  
   unsigned char/BYTE *raw_pixel_buffer)
```

## Explanation:

- Transform the pixels from raw pixel buffer to cbg format used pixels. Use height, width and depth you pass. Write the transformed pixel stream in a bitstream buffer.
- libcbg will return a “cbg\_codec::api\*” type struct pointer. Change to P15 to read more about this struct.

## Error codes:

- 0x1: Height or width are wrong.(negative or zero).  
Tips: check height and width and pass a correct num.
- 0x2: Wrong or not support color depth.  
Tips: check color depth and pass a correct num.

```
cbg_codec::api* cbg1_get_huffman_stream  
( int height,  
   int width,  
   int color_depth,  
   unsigned char/BYTE *raw_pixel_buffer)
```

## Explanation:

- Encode the pixels to cbg format style huffman coding(cbg format is using a special huffman tree).Use height, width and depth you pass. Write the huffman coding bit stream in a bitstream buffer.
- libcbg will return a “cbg\_codec::api\*” type struct pointer. Change to P15 to read more about this struct.
- libcbg will use default huffman coding settings(multithreads).

## Error codes:

- 0x1: Height or width are wrong. (negative or zero).  
Tips: check height and width and pass a correct num.
- 0x2: Wrong or not support color depth.  
Tips: check color depth and pass a correct num.

```
cbg_codec::api*
```

```
{  
    unsigned long long buffersize;  
    unsigned char buffer[];  
}
```

- `unsigned long long buffersize;`

The size of this buffer.

- `unsigned char buffer[];`

The binary stream buffer pointer. Size of this buffer is recorded in “unsigned long long buffersize”.
